

At your request, we will be happy to put a logo or lettering on our Bottlelight, which you can have done in one of the following ways.

Laser engravings are scratch-resistant, whereas imprints by tampon-print or inkjet printing are not as force-resistant but have a stronger contrast to the aluminium tube.

The cost indications can be found in our separate offer. We will make you an exact offer when you have sent us the following data required for this:

- the logo as a PDF or vector graphic,
- the indication of the size and the colour and
- the placement on the lid or the aluminium tube with dimensions.

On request, we can also insert batteries into the printed / engraved bottlelight for you.

We show you a few examples below.

### 1) Laser engraving on the lid of a bottle light

Laser engraving usually creates a white matt surface in the polished aluminium of the lid, which can also appear grey depending on the incidence of light. Examples are shown below. Darker grey laser engravings - see below in the pictures of the aluminium tubes - are also possible, which are a little more complex and expensive.

In general, there are one-off set-up costs and the respective unit costs.

Please also note a minimum order quantity of 100 pieces.

### 2) Laser- Engraving on the side of the aluminium tube

The laser engraving usually creates a white matt surface in the aluminium tube, which can also appear grey depending on the incidence of light. Dark grey laser engravings are also possible, which are a bit more complex and expensive. Examples are shown below: (A) white engraving, (B) dark grey engraving.

In general, there are one-off set-up costs and the respective unit costs.

Please also note a minimum order quantity of 100 pieces.

**3) Highly transparent stickers on the side of the aluminium**

We use highly transparent, strongly adhesive stickers with the dimensions 55 x 15 mm, which we can print in black or silver, using temperature transfer printing with a smudge-proof resin. The stickers look valuable and are affordable even for small quantities.

In general, there are one-off set-up costs and the respective unit costs.

Please also note a minimum order quantity of 50 pieces.

**4) Tampon-print colour imprint on the lid or the aluminium tube**

A tampon print colour print is a relatively firm, permanent print that starts to pay off for higher quantities from 500 pieces. A corresponding stamp must be made for each colour, and these are printed one after the other.

This incurs high one-time setup costs, with the unit costs being relatively low.

Please note a minimum order quantity of 500 pieces.

80%

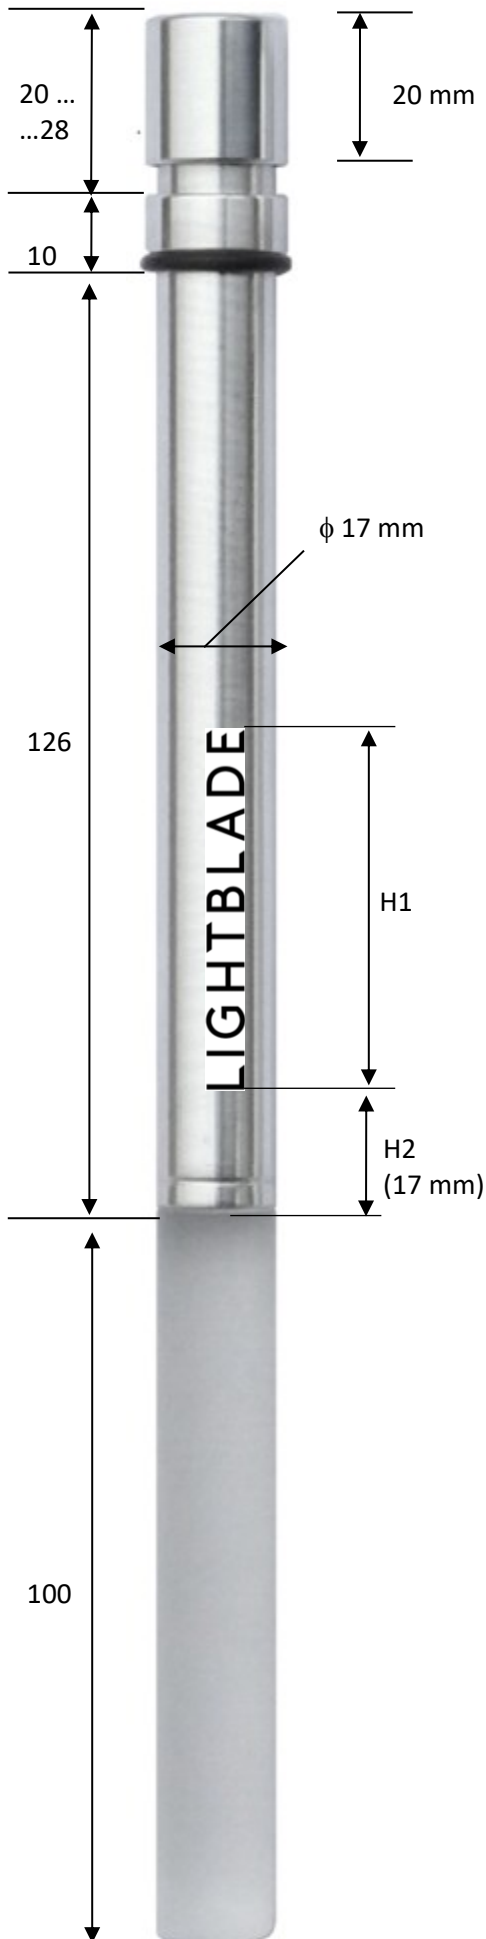

**5) 4-colour inkjet printing on the lid or the aluminium tube**

Any colour images can be displayed on the aluminium lid or the aluminium tube.

However, scratch resistance is not as good as the other methods listed above.

Please also note a minimum order quantity of 100 pieces.
