

We offer the following options for customer-specific bottle designs.

1) **Bottle engraving by sandblasting:**

Bottle engravings by sandblasting are always very beautiful and of high quality and have a particularly beautiful surface contour. The engravings are made at the glass bottle and are accordingly scratch and wash resistant.

For this we need the digital data of your logo / lettering and further information, see below.

2) **Bottle engraving by laser:**

Bottle engraving using lasers has the advantage that the laser beam can also depict very fine structures made up of many thin lines or small area.

For this we need the digital data of your logo / lettering and further information, see below.

3) **Bottle printing:**

We offer bottle printing in 4-color inkjet printing, which is coated with a clear varnish after colour printing, to achieve better scratch resistance.

However, printing is never as scratch-resistant as one of the bottle engravings described above.

For this we need the digital data of your logo / lettering and further information, see below.

If you want to develop a new logo for a bottle engraving from a picture or a hand sketch, we are happy to help you and we will refer you to a corresponding company or glass workshop associated with us.

For a valid price offer, we always need the following data and information:

- Your logo or lettering, preferably as a PDF or as a vector graphic,
- the desired position and size of the engraving (see last page) and
- the number of times you want the logo to be shown (for example on the front and back of the bottle).

Example :
